Cooperatives Service

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Station and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Economics, Statistics and Cooperatives Service, USDA, Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

INTRODUCTION AND SUMMARY OF THE 1977 FIELD CROPS SEASON

INTRODUCTION

This publication presents 1977 statistics as well as historic field crop data for Florida. It covers the period 1967 through 1977 and is a follow-up to the publication issued in 1968 which contains historical data on Florida field crops from 1919 through 1966. The bulletin continues the historical series and replaces the annual issues since 1968. Some state and county estimates for 1972 through 1976 have been revised from those published previously for certain crops because of changes in total acreage or production for these crops resulting from the review of the 1974 Census of Agriculture.

A particular effort has been made to meet the diverse needs and interests of different users and to provide a reliable reference on state acreage, production and value for most of the field crops grown in the state, and county acreage and production for major field crops. Users needing current data are served by reports issued periodically throughout the year based on the latest data available at that time. The estimates on these reports are subject to changes as more complete data become available. Annual summaries will continue to be published in order to update the series and to provide a medium for publishing revisions.

SUMMARY, 1977 SEASON

Temperatures during the early months of 1977 averaged below normal. During the mornings of January 18, 19 and 20 the state experienced an extremely severe and damaging freeze. There was heavy damage to sugarcane and light damage to small grains and early seeded tobacco plant beds. Rainfall during January and February was heaviest in the northern and western portions of the state. The wet soils combined with below normal temperatures delayed land preparation and planting of field crops. Once planted, crops made fair progress early in the season but by mid-April dry weather was beginning to take its toll. The drought continued well into the late spring months reducing yield and lowering crop quality. The large corn acreage suffered the most damage.

Late summer and early fall weather was near ideal for harvesting crops. Most crops had been harvested by the end of November except soybeans and cotton which continued into December.

The acreage planted to corn in 1977 continued to increase and was the largest since 1952. However, acreage harvested for grain from this drought and aflatoxin ridden crop totaled only 299,000 acres, the lowest since 1970 when the acreage for harvest was reduced by southern corn leaf blight. The average yield was only 35 bushels per acre compared to 60 bushels in 1976. Yields would have been lower if farmers had harvested more of the damaged acreage. Price for corn averaged only \$1.60 per bushel. The low price was due mainly to the poor quality caused by the heavy infestation of aflatoxin in much of the crop.

The acreage of sugarcane harvested for sugar and seed totaled 300,000 acres, nearly one percent above the 1976 season. Of this total, 285,000 acres were harvested for sugar and the remaining 15,000 acres were harvested and used for seed. Average yield was 29.9 tons per acre. Cane production for both sugar and seed totaled 8,970,000 tons, down 8 percent from the previous season. The season average price and value of production for the 1977 crop will be available in January 1979.

Soybean acreage increased sharply in 1977 when a record 334,000 acres were planted. The area harvested for beans totaled 327,000 acres. The average yield per acre was 24 bushels, down two bushels from 1976. Prices were lower than 1976 and averaged \$5.50 per bushel. Value of production in 1977 totaled \$43,164,000 -- down six percent from the year before.

Hay production totaled 452,000 tons, nearly six percent above the record set in 1976. The total area harvested was 226,000 acres, three percent above the year before. The average yield was 2.00 tons per acre, slightly above the 1976 yield. Price of hay was well above the previous year and averaged \$63.00 per ton. The value of hay produced in the state was \$28,476,000 -- up 17 percent from 1976 and a new record.

The total area planted to cotton was 6,200 acres, down 16 percent from 1976. Of this total 6,100 acres were harvested. In 1977 the average yield was 425 pounds of lint per acre. The yield was 89 pounds less than the year before but 79 pounds above the 1975 yield. The average price per pound of 48.0 cents was well below the 1976 average of 72.9 cents. The value of production was \$1,244,000, less than one half the value of the 1976 crop.

The total area planted to peanuts held steady at 63,000 acres. Of this total, 55,000 acres were harvested for dry peanuts. The balance of 8,000 acres were harvested for green peanuts and other purposes. Yield per acre at 3,100 pounds was 100 pounds above 1976 but below the record of 3,230 pounds set in 1975. Prices were slightly above 1976 and averaged \$414.00 per ton. Value of the crop at \$35,294,000 was five percent above the previous year.

There were 11,700 acres of flue-cured tobacco harvested in 1977 -- down nearly 16 percent from 1976. The average yield was 2,100 pounds per acre -- 60 pounds less than last year. Price for all grades averaged \$1.20 per pound, well above the 1976 average of \$1.10 per pound. Value of production was \$29,484,000 -- down 11 percent from 1976. There were only 140 acres of shade tobacco harvested in Florida in 1977. The average yield was 1,630 pounds, 50 pounds less than 1976. Total production was only 228,000 pounds, down nearly two thirds from the previous year. Prices received averaged \$4.00 per pound and the total value of the crop was less than a million dollars.
